

EUROPE'S GOOD ROADS WYANDOTTE IN FAVOR

Regarded as Economic Factor of Excels in Ability to Be Pushed for Life and Not a Fad.

Legacy Left by Romans Has Been Husbanded and Has Added to Prosperity of France-Austria is Close Second.

The wide interest that the road question has for all classes in Europe is remarkable, and it is this unity of purpose that builds on the network Milton writes in the Scientific American. Since that time, and that of the breed. Henris and the Louises, to whom were due much of the elements of rank about with the Plymouth Rocks beauty that compose the French road system today, particularly with respect to tree planting alongside, and since the later day of the military road making genius of Napoleon much has been undertaken in the way of refinement which has produced, if not an actual money return, at least a prosperity which would otherwise have been unknown.

To be just there are as good rovds in the United States today as in France. In top dressing, in/comport with the needs of the new Jocomotion ccording to any one of the four of ave methods commonly made use of in America, results are superfor even to anything yet achieved in Europe.

Brick is found on some roads of Holland, but it dates from before the or car era, before even that famous pavement of Terre Haute, Ind., owning already to some twenty years and still good. Great claims of dura-

south, near Marseilles. Straight as an arrow, flat as a billiard table and as marble, with a row, of windbreak cypresses on the rorth, which in the writer's opinion is the ideal roadway. French nadepartmental and communal roads, as a class, are the best in the

In the French Alps are the finest mountain roads in Europe, far and away ahead of those of Switzerland on all counts. Many of them were due to the genius of Napoleon and his military road builders, and if their main purpose in times past was strategic, today they are essentially prac-

The mountain roads of Austria are a close second, particularly when it comes to considering them from the point of view of the motor car.

Italy has a nationalized roads sysem; so has Belgium, Austria and of the German confederation. The first three meet the situation but partially, organization and control beng decidedly inferior to that in

MAINTENANCE OF GOOD ROADS

With Enthusiasm for Improvement of Public Highways.

The present year promises to be the greatest in the history of the moveent for the improvement of the public roads of the United States, according to the reports received from all parts of the country by the United States department of agriculture. A ofnt committee of congress is enility of federal aid in the construcof public highways, and a number of he state legislatures are considering good road legislation. In connection with the general impetus that the good road movement has recently had in all parts of the country, the director of the office of public highways says:

upon the importance of maintenance in connection with the work of improving the roads. The people in nearly all the states are filled with enthusiasm for road improvement and in the construction of superb roads, and yet almost without exception they are making little provision to care for the roads after they are built. This is true not only in the various counties, but under many of our state high-

dition year after year requires a considerable annual outlay, but this outlay is infinitely less than the loss which must fall upon the people eventnally if they allow their roads to go to utter ruin. The thing for all advocates of good roads to do is to urge continuous, systematic maintenance, and the setting aside every year of an' amount per mile estimated by the engineer in charge to be sufficient for the proper maintenance of the road—a. how digestion; no digestion, no eggs; course which must make for economy notests, no dividends from the direction of efficiency."

Rapid Growth.

Breed Ranks About With Plymouth Rocks as Layers, but is More Active and Has Less Tendency to Overfatness.

(By R. G. WEATHERSTONE.) The Wyandotte is smaller than the Plymouth Rock, but an equally rapid grower. It is generally claimed that legacy left by the Romans, Frances | the White Wyandotte will stand pushing for rapid growth the best of any

> As layers the Wyandottes seem to but being somewhat more active and

The Rhode Island Red breed constitutes the latest addition to the list of popular American breeds of chickens. This variety differs from the majority of breeds in claiming for themselves an origin based solely on practical considerations.

They are partly of Astatic blood, but in their selection, which extends over a period of fifty years, attention has been paid to rapid growth and egg production, so that the breed today more nearly resembles the Leghorns than does either the Plymouth Rock or Wyandotte.

One fundamental difference still exists that shows the Asiatic origin of the red chicken, they being persistent

The Rhode Island Reds do no reproduce themselves with certainty as to shade of color or style of comb. but in practical points they may be considered a distinct and well-established breed.

In the eastern part of the United States are many farms keeping from one to several thousand hens and devoted exclusively to the production

of poultry and eggs for the market. The use of any breed on such farms should be good witness of its utility. The tabulation of the breeds used on such plants as are shown to the

writer gives the following results: White Wyandottes occupy first place, being used on about twice as many plants as any other one breed. Single-comb White Leghorns, Barred Plymouth Rocks and White Plymouth Rocks follow next in order. Rhode Island Reds, Light Brahmas, Buff Wyandottes, Buff Plymouth Rocks, Brown Leghorns and Black Minorcas are the other breeds in use. Leghorns, Minorcas and Rhode Island Reds are used on the egg farms Light Brahmas and Plymouth Rocks on the roaster and capon plants plants use Plymouth Rocks, Wyan dottes or Rhode Island Reds.

Cause of Gapes. Gapes are caused by a worm-like parasite that becomes attached to the hay, corn stover ad libitum, and corn. lining of the windpipe. EXPENSE OF PRODUCING MIL

nteresting Investigation Made by Dairy Department of Ohio College of Agriculture.

The people of cities who complain about the high price of milk may be is the leaking of the large crotches interested in knowing what it costs of cottonwoods. There is a strain of to produce and distribute good mar- the point where the two large limbs ketable milk. An investigation made meet, hence a partial splitting, maklast year by the dairy department of ing an opening from which the sap the college of agriculture, Ohio State exudes. This leakage is unsightly; university, shows that the average cost of producing a gallon of milk in Ohio is about 25 cents, or 6.25 cents per quart, allowing 3,200 pounds per cow per year as the average milk pro-

This takes into consideration the cost of feeds, labor, interest on investment, maintenance, insurance,

High-Producing Holstein.

taxes, etc. When the average milk production per cow is increased the cost of milk is decreased. The average cost of distribution is 31/2 cents per quart, making a total of 9.75 cents per quart as the cost of producing milk and delivering it to the consumer. This means that when the milk retails at ten cents a quart, the average producer and distributer is making little or no profit in the trans-

profit in the dairy business. However, it is the average producer, who keeps average cows, the increasing cost of feeds and labor, and the greater demand for sanitary conditions that are contributing to the high price of

Dairy Cow Is Often Required to Work Under Unfavorable Influences-Make Plans Now.

Farmers who are going to build harns next summer should make arrangements now to put in the King system of ventilation in their stables. It is not expensive if you make calcu lations in time

The Washington Agricultural college has the following to say on the necessity of ventilation:

"Dairy barns are very frequently poorly ventilated. The dairy row is then not only required to live, but to work under unfavorable influences. and she often falls a victim to such diseases as tuberculosis, pneumonia bronchitis and colds. Foul air is one of the prime factors in the production of such diseases. Since the advent of sanitary science in connection with ventilation, the air space allowed for taining the insects is rendered useless each animal has been increased, and a and dies. number of methods of ventilation have been devised. The exercise of a little care in such matters will protect the health of animals, prevent premature death and also make possible the highest working efficiency of the herd.

DAIRY RATION WITH SPELTZ

Experiments Show It to Be Worth About 13 Per Cent. Less Than Corn for Milking.

A ration consisting of 30 to 35 pounds of silage, 5 pounds of alfalfa

We can say, however, that if the week. Remove the parasites from the speltz is worth as much as corn we windpipe with a feather dipped in would not advise using it, says an exchange. Experiments indicate that will keep the soil cool and moist, the speltz, more properly termed Emmer, is worth about 13 per cent. less than

corn for milk-making purposes. A mixture consisting of 400 pounds corn chop, 200 pounds bran, 400 pounds speltz, will supplement the roughage suggested very nicely. One pound for each 31/2 pounds of milk should give the cows ample nourishment for doing reasonably good work. If speltz is omitted from the cover thirteen eggs again and raise work. If speltz is omitted from the her own little family when these are mixture, a combination of 500 pounds of corn chop and 300

combination.

time of year. Bad germs will propa- any attention to small fruit growing gate in the crevices and the milk will and where strawberries, grapes, curlack of fresh, sweet flavor. Throw rants and such fruits might be grown away every rusty can and get good with profit.

STRENGTHEN A WEAK CROTCH

Defective Places May Be Braced by unning Iron Rod Through Two Limbs of Tree.

By W. W. ROBBINS, Colorado Agricul-tural College.) Many trees have weak limbs and develop bad crotches. In some cases

these result from injudicious pruning, while often they are the expression of the natural habit of the variety. A familiar sight on our streets furthermore, weak crotches of trees are dangerous to life and property. In most cases weak crotches may be easily braced.

An excellent method of strengthen ng a weak crotch is to run an iron rod through the two limbs which form the undesirable crotch. A hole is bored through the two limbs a short distance above the crotch. This hole should be made to fit the rod as nearly as possible; this hole will not injure the tree. The rod should have large head at one end and be threaded for a large nut at the other. The rod is inserted and the nut screwed up tightly. A one-inch od will support a tremendous strain. out the size will depend, of course, upon the size of the limbs to be

DYNAMITE FOR TREE HOLES

Found to Be Satisfactory Method in Replanting an Old Orchard-Use Care With Caps.

(By W. A. IRVIN.) I have used dynamite for digging holes for trees, and am still using it with satisfactory results. It is a good plan to use in replanting an old orchard. In my fifteen-year-old orchard there were rocky spots where the sub soil plow failed to penetrate when the orchard was first planted, and two or DRS. HELTSLEY & HELTSLEY were dug with pick and shovel, have

the work all right. There is little danger in handling the dynamite, but great care must be used in handling the caps which explode it. I use half a stick of dynamite for opening a hole in which a tree is to be set, and a whole stick is used to blow out an old tree. My men cut the fuse the length wanted. and bore or gouge a hole in the dyna-NEED FOR GOOD VENTILATION mite, in which the cap is inserted; the dynamite is then tied fast in the hole. A crowbar is used to punch a California and the hole in the soil to depth of about two

Saved Girl's Life

"I want to tell you what wonderful benefit I have received from the use of Thedford's Black-Draught," writes Mrs. Sylvania Woods, of Clifton Mills, Ky.

"It certainly has no equal for la grippe, bad colds, liver and stomach troubles. I firmly believe Black-Draught saved my little girl's life. When she had the measles, they went in on her, but one good cose of Thedford's Black-Draught made them break out, and she has had no more trouble. I shall never be without

ACK-DRAUGH

in my home." For constipation, indigestion, headache, dizziness, malaria, chills and fever, biliousness, and all similar ailments, Thedford's Black-Draught has proved itself a safe, reliable, gentle and valuable remedy.

If you suffer from any of these complaints, try Black-Draught. It is a medicine of known merit. Seventy-five years of splendid success proves its value. Good for young and old. For sale everywhere. Price 25 cents.

FOR STARTING BALKY HORSE

Common Bamboo Fish Pole With Electrical Contrivance to Give Shock le Quite Effective.

Take a common bamboo fish pole and cut it into lengths of about five feet, writes Edw. E. Herbert in the Popular Electricity. With a threethrough the center of the pieces. Join Insert two insulated wires through the pole, terminating at the larger end in across the tube.

At the outer ends of the small cross piece fasten two brass or copper washers about an inch in diameter and attach the two insulated wires

Electrical Starter.

running through the pole, one to each. If a metal cross piece is used, one terminal should be insulated by a rubber or fiber washer. By means of a flexible wire attach the secondary of an ordinary shocking coil to the termi- All Fowls That Have Passed Their nals at the near end of the pole. The coil and dry batteries of two or three cells can be carried in a small box on the wagon. When the horse is balky all you have to do is to turn on the battery, place the two terminals at the says the Poultry Journal. All hens | Journal. outer end of the pole back of the ears that have passed their term of usefulof the animal and it will go at once. This apparatus has been tried out by ing should be continued throughout the writer on some of the worst balky the entire year, the most heroic work horses and has never failed yet.

EXPENSE OF HANDLING EWES

Every Farmer Should Figure Out Cost of Feed-Pays Better to Wean Lambs Before July 1.

Prof. E. W. Sheets of the West Virginia experiment station, in discussing the question of breeding ewes, said that he believed every flock owner should sit down and figure out the cost of the feed.

In the fall he feeds breeding ewes once a day on oats and bran; feeds no corn whatever to the breeding ewes. Uses clover, cowpes and mixed hay and corn fodder for roughage. The latter it pays to shred or cut. His Southdown sheep eat about six pounds of silage apiece a day, two pounds of hay and one-half pound of grain, but he does not give the ewes to much sitage as this before lamb-

He feeds the lambs with the ewes starting with about haif a pint of grain to the lamb at eight weeks old, and getting up to a pint of grain at about twelve weeks old. This feed is entinued throughout the season. After the lambs are weaned he puts the ewes on a stubble field to de-crease the flow of the milk. He rives tobacco, which he raises himself, in the feed each day as a pre-

ventive of stomach worms. He thinks it pays better to wean tambs the 1st of July than at any other time. It costs him \$3.06 to keep a sheep a year, but he did not charge present market prices for his feed, adopting a scale of prices that would run about the average for a

e sure the flock has plenty of fresh wat.r. If the sheep drink from spring " keep the approaches dry. Avoid the elephantine hog or steerthey to freaks that cannot be relied upon to give carenss of great value, corn alone.

WATER REQUIRED FOR SHEEP Why

Animals With Bountiful Supply Produce More Mutton Than Those That Are Deprived of It.

Experiments carried on with cattle showed that cattle given plenty of water with their pasture contained more moisture and less dry matter than did the carcasses of cattle given pasture but no additional moisture. it is a generally accepted principle of feeding that it costs more and more to produce meat as the moisture decreases and the dry matter increases. From this we are able to deduce the fact that it costs less to grow the steers that had plenty of water, and so made watery carcasses, than it did to grow the steers that had no water other than that in their food and reproduced a dry carcass.

What is true in the case of steers would hold equally true in the case of sheep. Sheep given plenty of water will produce mutton more cheaply than will those deprived of it. Muscle foot bell hanger's bit bore a hole expansion will be more active in the one case than in the other, and that the sections with brass or steel tubing. is another reason why mutton production would be cheaper.

There is considerable water in any two small binding posts. On the other of the pasture crops that sheep eat, end of the pole place a brass or cop- and they get still more moisture from per tube that will fit snugly, and flat- the dew that collects on the grass ten it out slightly. Bore a hole blades in early morning and late evethrough the middle of this and bolt a ning; but from these two sources, wooden piece about three inches long while it gets enough water to keep it alive, a sheep still does not get enough water to keep it in the very best growing condition nor to keep all its bodily processes going on in the most effective manner possible.

There is not an organ in the body that can function properly without water to aid ti. Being one of the chief constituents of blood, water is carried to every part of the system, and not alone helps it in getting its nourishment, but also in ridding it of its impurities. It is obvious that a large amount of water must be necessary to keep the sheep doing well. Enough is not gotten with the food, even in summer, and this amount should be supplemented by all that the sheep will drink when given constant access to it.

CULL OUT UNDESIRABLE HENS

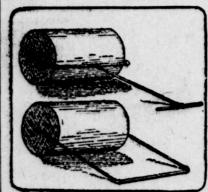

Term of Usefulness Should Be Marketed at Once.

It is always seasonable to cull out the undesirable birds from a flock, ness should be marketed. While cullshould be done in the fall. What we call yearlings in poultry are those which were hatched the year before the pullets. They are nearer two years old than one, and make excellent breeders. After breeding pick out of this flock such as are considered unprofitable. What we call the two-year-olds are the ones that are going into their second molt. Very often some excellent layers are found among these, and it pays to keep such, but at that age the closer we cull the better will be our profits. This culling, however, can only be successful by close watching. No matter how valuable a hen may be, if she proves to be a feather puller or an egg eater, she, too, should be sent with the lot of culls to market.

HOMEMADE LAWN ROLLER

Practical and Substantial Implement Will Keep Grass in Fine Shape and Discourage Moles.

Frequent rolling with a heavy roller keeps the lawn in fine shape and helps discourage moles from working in it, says the Farm and Home. A practical and substantial roller for this purpose may be made of cement with gaspipe axle and handle. It should weigh about 200 pounds and should

be about two feet long. A piece of 15-inch salt-glazed sewer tile makes a good form. Forms can also be made of wood from narrow slats or galvanized iron. In the latter case the form may be left on the roller.

Do Not Feed Moldy Corn. Moldy corn will produce blind staggers in horses, and it should never be fed to them. Every year there is considerable trouble with this disease in the west, and in almost every case the cause is moldy corn. If this corn does not produce blind staggers, it will tend to injure the physical condition of the animal. So don't feed it, and be careful about pasturing the herses in stalk fields where there is moldy corn.

Using More Brains. In live stock and dairying, brains are more used today than brawn.

Corn Alone Unprofitable. Hogs cannot be raised profitably on
